

Web Work Version 6 – Upgrade Notes

0.1 Quantity On Order (QOO) Change in Formula

We made a fundamental change to the way Web Work calculates an Inventory Item's, Quantity On Order (QOO). This change will occur when upgrading to Version 6 from any previous version.

The new formula for calculating an Inventory Item's QOO is:

QOO = all **Approved** PO Lines for an Item that have not been Received

The old formula was:

QOO = all PO Lines for an Item that have not been Received

The new formula only takes into account Approved Purchase Orders. This means that your QOO will change when you upgrade to Version 6. Please be advised to make any adjustments you require for your business.

Please be advised that if a PO has NOT been Approved, it will NOT be counted as part of the Item's Quantity On Order. You must Approve a PO to get the Item's order amount to add to the Item's Quantity On Order.

NOTE: If, on an old PO, you receive more items than you may have ordered, Web Work will treat that negative result in a Quantity On Order as zero. For example, if you ordered 10 items and received 11, the Quantity on Order calculation would be zero not negative one.
